Key Data: Marijuana Prevention Points of Consideration

The Marijuana Prevention Initiative (MPI) works with partners in each of San Diego County’s six regions to reduce youth marijuana use and increase knowledge of its harmful effects. This document provides selected county, state, and national data regarding youth marijuana use and related health and community impacts. These data points provide relevant marijuana use/perception statistics to help inform marijuana prevention efforts currently underway across San Diego County.

San Diego County Data

Youth Marijuana Use

- The percentage of 9th and 11th graders who reported using marijuana in their lifetime has been increasing since 2007.
- In 2011, approximately 26% of 9th graders and 39% of 11th graders reported they had used or tried marijuana sometime in their life (CHKS, 2009-2011).
- Approximately 1 in 5 high school juniors reported using marijuana sometime in the past 30 days (CHKS, 2009-2011).
- The percentage of 9th and 11th graders who reported smoking marijuana in the last 30 days has increased 50% from 2007-2011 (CHKS).
- Use among 7th graders has not changed substantially over the past 10 years. On average, nearly 10% of 7th graders reported using marijuana sometime in their life, and approximately 5% reported using it in the past 30 days (CHKS, 1999-2011).
- Approximately 24% of high school students in the San Diego Unified School District reported that they are currently using marijuana, and over 8% reported that they have used it on school property in the past 30 days (CDC, 2011).
- Nearly 11% of high school students in the San Diego Unified School District reported trying marijuana for the first time before they were 13 years-old (CDC, 2011).

Access to Marijuana and Perception of Harm

- Approximately 70% of 11th graders in San Diego County reported that marijuana is “very easy” or “fairly easy” to get (CHKS, 2009-2011).
- Approximately half of San Diego County 7th, 9th, and 11th graders do not believe that people greatly risk harming themselves when smoking marijuana once or twice a week (CHKS, 2009-2011).
- From 2009-2011, the percentage of students who believe that smoking marijuana is very harmful has declined (CHKS).
- High school students in San Diego County (9th and 11th graders) perceive occasional marijuana smoking as less harmful than occasional cigarette smoking (CHKS, 2009-2011).
Marijuana Prevention Initiative

- Although relatively few young people believe that smoking marijuana is harmful, approximately 80% of San Diego County adult residents believe that smoking marijuana daily or weekly is harmful to one’s health (Community Perception Survey, 2011).
- Approximately 34% of San Diego County adult residents perceive recreational marijuana use to be a problem in their community (Community Perception Survey, 2011).

**Treatment Admissions Data**

- The average potency of marijuana has increased sixfold since 1978, which may contribute to higher rates of youth addiction (NIDA, 2009).
- Marijuana is overwhelmingly the drug of choice for adolescents admitted into drug treatment programs, with approximately two-thirds of all adolescent admissions due to marijuana use (County of San Diego Strategic Prevention Plan, July 2011).
- The number of adolescents in San Diego County treatment programs for marijuana abuse has doubled between 2004 and 2008, from 738 to 1,579 (CARS, 2010).

**Implications of Marijuana Use Across California and the U.S.**

**Drugged Driving**

- Only 11% of people who tested positive for THC (the psychoactive ingredient in marijuana) in the California Roadside Survey believe that driving under the influence of marijuana is harmful (OTS, 2012).
- Cases involving driving under the influence of marijuana are more likely to settle, not be charged, or be dismissed than those involving alcohol (Tashima and Hanson, 2011).

**Driving Under the Combined Influence of Alcohol and Marijuana**

- California drivers are as likely to test positive for THC as alcohol (OTS, 2012).
- Approximately 25% of persons testing positive for THC in the California Roadside Survey also tested positive for alcohol or another drug (OTS, 2012).
- Severe marijuana-induced driving impairment is observed with high doses, chronic use and in combination with low doses of alcohol (Couper and Logan, 2004).

**Implications of Drugged Driving**

- Driving under the influence of THC is associated with (Couper and Logan, 2004):
  - Decreased car handling performance
  - Increased reaction times
  - Inability to maintain headway
  - Subjective sleepiness
  - Motor incoordination
  - Impaired time and distance estimation
  - Increased lateral travel
Marijuana Prevention Initiative

**Academic Achievement**

- Among adolescents, marijuana use is associated with attention and memory problems, slower brain processing, and difficulty with problem-solving – all of which may affect academic performance (Medina et al., 2007).

- Heavy marijuana use is associated with higher rates of skipping class, lower GPAs, and failure to complete college (Arria et al., 2013; Hunt et al., 2010).

- Adolescents who have smoked marijuana more than 100 times are less likely to enter college or earn a college degree and are more likely to drop out of college than their peers who have not (Fergusson et al., 2003).

- Middle and high school students (ages 12-17) with an average grade of “D” or lower reported significantly higher rates of current marijuana use in the past month compared to those with an average grade of “C” or higher (SAMHSA, 2009).

- Young adults (ages 18-23) who did not complete high school reported significantly higher rates of current marijuana use than those who completed high school (SAMHSA, 2009).

**Impact on the Developing Brain**

- Smoking marijuana is significantly associated with the onset of psychotic disorders, particularly schizophrenia (Large et al., 2011; Moore et al., 2007; Semple et al., 2005; Veen et al., 2004).

- Children and adolescents can become addicted to marijuana more often and more rapidly than adults because their brains are still developing (CSAM, 2012).

- The combination of marijuana and alcohol is more addictive in adolescents than in adults (Muoio, 2012).

**Data Sources**
